

Collectibles can trigger obsessive-compulsive disorder in vulnerable people

Published: Tuesday, March 15, 2011 - 11:03

The massive marketing campaigns launched by publishing houses at the start of the academic year can cause people bound to suffer obsessive-compulsive disorder to develop this pathology before. The fact is that collecting articles without control is a symptom of this serious psychological disorder –one of which most known variants is Diogenes syndrom– and of shopping addiction. These are two mental disorders affecting approximately 12% of the population. Porcelain dolls, precious stones, world thimbles, watches, fans, dinosaurs, language courses, and tanks and ships in parts are some of the articles that often crowd our stands. In principle, and "as long as this hobby is performed under control" collecting items is good from the psychological point of view, as it helps in developing positive skills and attitudes as perseverance, order, patience or memory –among other.

However, professor **Francisca López Torrecillas** at the Department of Personality, Psychological Assessment and Treatment of the [University of Granada](#), and an expert on addictions, warns that in the recent years, "a very significant increase has been observed of cases where uncontrolled collecting has caused obsessive-compulsive disorder and shopping addiction".

Perfectionism and Meticulousness

The researcher points out that certain attitudes as the need of control, perfectionism, meticulousness and extreme order "are very frequent traits in people who likes collecting articles. However, they are also closely related to the psychological disorders mentioned above".

López Torrecillas states that collecting can become an obsession, and so, a disorder "in individuals specially vulnerable", i.e. individuals with low self-esteem, poor social skills and difficulty in facing problems". When people have this feeling of personal inefficiency, "compulsive collecting helps them in feeling better".

The [University of Granada](#) professor affirms that "the excessive pressure and aggressive marketing that many publishing houses employ in certain months through the media may cause individuals bound to suffer this disorder to develop it".

Nonetheless, López Torrecillas states that, as it occurs with other things in life "controlled collecting has numerous benefits from the psychological point of view", and she warns that "further study is needed in this field of research".
