Washington, May 12 (ANI): Spanish researchers have confirmed that botox treatment can reduce the number of migraines experienced by many sufferers.

University of Granada scientists said that injecting a local anesthetic or botulinum toxin (botox) into certain points named 'trigger points' of the pericranial and neck muscles reduce migraine frequency among migraine sufferers.

They have identified the location of these trigger points -whose activation results in migraine- and their relationship with the duration and severity of this condition.
